I. Objectives

In this section, the goals in this laboratory are:

- To describe the conceptual design and the technical design of the system
- To transform the requirements into a working system

II. Methods

Design is defined as the creative process of transforming a specific problem into a workable solution. This report details the **Conceptual Design** to validate that all client requirements are addressed before proceeding to technical implementation.

Preliminary Design Review (Conceptual Design)

The following design elements address the client requirements for the nail services website:

1. Interface and User Experience (UX)

- **Visual Style:** The system will feature a "simple, elegant yet minimalist style" to maintain a professional appearance.
- **Accessibility:** The interface is designed for both PC and mobile access, ensuring a mobile-friendly experience for clients on the go.
- **System Preferences:** Users will have the ability to toggle between dark and light modes.
- **Color Palette:** The design will utilize a specific scheme consisting of navy blue, light blue, beige, and off-white.

2. Software Architecture and Modules

- **Client Module:** Includes functionality for login/signup, guest booking options, and a system for managing automatic reminders and rebooking.
- **Booking & Calendar Subsystem:** A central booking system and calendar that enforces a business rule of accommodating a maximum of three clients per day.
- **Payment & Tracking Module:** A system to accept and track payments (Cash and GCash).
- **Admin Dashboard:** A private interface for the owner to manually set available dates, adjust prices, and view business analytics.
- **Gallery Management:** A feature allowing the admin to upload photos of their work with automatic or manual watermarking for protection.

3. Data Structures and Requirements

- **Client Profiles:** Data fields will store essential information such as client phone numbers, feedback/reviews, and specific health-related data like allergies.
- **Service Data:** The database will manage descriptions and pricing for specific services: Gel overlay (₱199), BIAB (₱299), and Soft gel extensions (₱499).
- **Design Uploads:** The system must support image data structures that allow clients to send and store their own preferred nail designs during the booking process.

III. Results

Figure 1: Home Page

Figure 2: Services

IV. Conclusion

This progress report outlines the conceptual framework for the nail services website, ensuring that every functional requirement from the 3-client daily limit to the integrated GCash payment tracking is integrated into the design architecture. By validating these designs now, the development team ensures the final system will align with the client’s minimalist aesthetic and operational needs.
